TITLE: Non-crystalline minoxidil composition

Brief Summary Paragraph Right (4):

European patent application No. 177,223 discloses a liposomal minoxidil composition in which minoxidil is present (1) in solution form possibly in a supersaturated state, either encapsulated in lipid vesicles, or in the aqueous or lipid phases of a liposome suspension, and (2) in a finely divided crystalline (solid) form both within and outside the lipid vesicles. Preferred embodiments of the composition are formed by hydrating a minoxidil lipid film containing a saturated phosphatidylcholine (PC), such as dipalmitoylphosphatidylcholine (DPPC), cholesterol, and minoxidil in ethanol/propylene glycol and water. Minoxidil is present at a final weight concentration of between about 1.2-3%. The composition was found to contain liposomes of various sizes between about 1 .mu. to 15 .mu., and more importantly minoxidil crystals. Although the formulation is reported to increase drug uptake by the epidermis when applied topically to skin, it has the same limitation as the above non-liposomal formulation in that the drug is applied to the skin largely in crystalline form.
